+

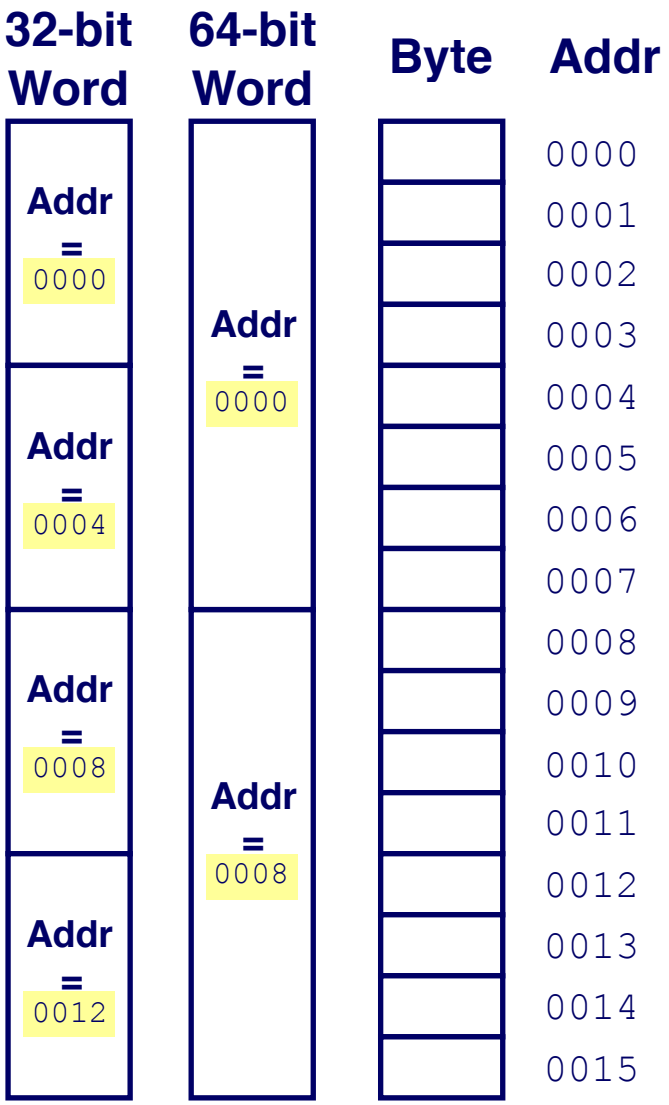
Word Size & Endianness

Word size

- Any given computer architecture has a “word size”.
- Word size determines the number of bits used to store a memory address (a pointer in C).
- Therefore you can $2^{wordsize}$ number of memory addresses.
- Until recently, most machines used 32 bits (4 bytes) as word size
  - Limits addresses to 4GB of total RAM
- These days, machines have 64-bit word size, actually only uses 48 bits of it for addresses
  - Potentially, could have 2^{48} addresses, thats a lot of memory.
  - Theoretically up to 65,000 times amount of RAM of 32-bit systems. (~260TB)

Word-oriented memory organization

- Address of a word in memory is the address of the first byte in that word.
- Consecutive word addresses differ by 4 (32-bit) or 8 (64-bit).

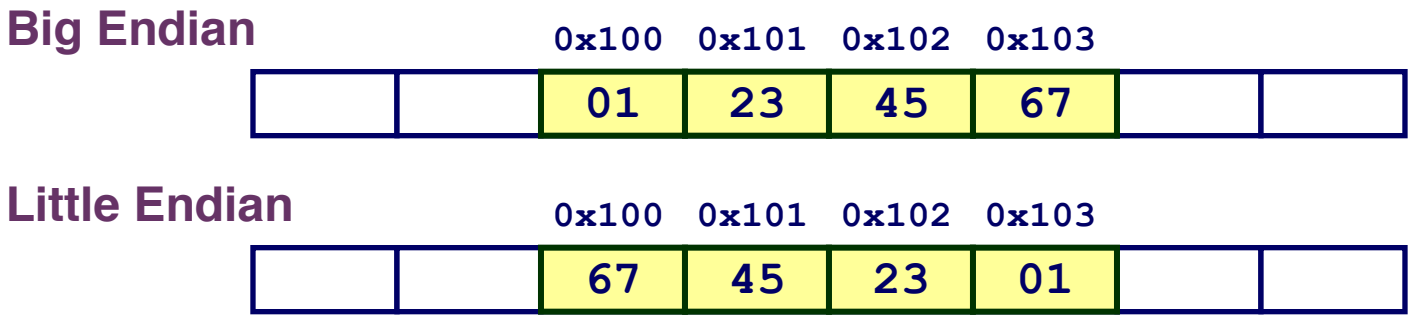


Byte ordering in a word

- There are two different conventions of byte ordering in a word
- **Big Endian**
  - Examples: Sun, PowerPC Mac, Internet
  - Most significant byte has lowest address
- **Little Endian**
  - Examples: x86, ARM processors running Android, iOS, Windows
  - Most significant byte has highest address
- In other words, if you have a multi-byte word, what order to the bytes appear? What "end" of the word does the MSB live at?

Byte ordering in a word *con't*

- Variable *x* has 4-byte *value* of *0x01234567*
- Address given by dereferencing *x* is *0x100*



- We can test this programmatically. See *memory/endian.c*

Byte ordering representation in C

- Casting any pointer to unsigned char* allows is to treat the memory as a byte array.
- Using printf format specifiers
  - %p - print pointer
  - %x - print value in hexadecimal
- See *memory/byte_ordering.c*

+

Floating Point

Fractional binary numbers

- How can we represent fractional binary numbers?
- One idea: use same approach as with decimal numbers, except use powers of 2 (as opposed to 10).
- So what is $\mathbf{1011.101_2}$?

Fractional binary numbers

- How can we represent fractional binary numbers?
- One idea: use same approach as with decimal numbers, except use powers of 2 (as opposed to 10).
- So what is $\mathbf{1011.101_2}$?

  $(1 * 2^3) + (0 * 2^2) + (1 * 2^1) + (1 * 2^0) + (1 * 2^{-1}) + (0 * 2^{-2}) + (1 * 2^{-3})$

  $8 + 2 + 1 + ½ + ⅛$

  11.625_{10}

Fractional binary numbers

- How can we represent fractional binary numbers?
- One idea: use same approach as with decimal numbers, except use powers of 2 (as opposed to 10).
- So what is $\mathbf{1011.101_2}$?

  $(1 * 2^3) + (0 * 2^2) + (1 * 2^1) + (1 * 2^0) + (1 * 2^{-1}) + (0 * 2^{-2}) + (1 * 2^{-3})$

  $8 + 2 + 1 + ½ + ⅛$

  11.625_{10}

- Going the other direction
  - 5 3/4 —> 101.11_2
  - 2 7/8 —> 10.111_2

Insufficient representation

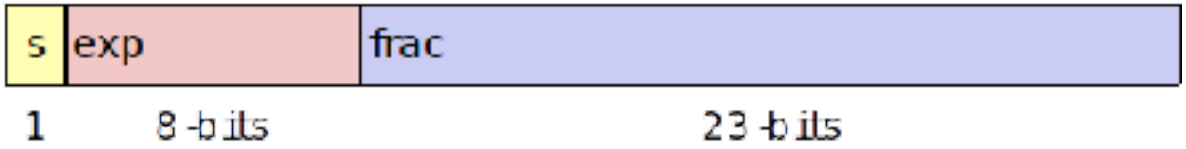
- That way of representing floating point numbers is simple, but has two significant limitations.
  - Only numbers that can be written as the sum of powers of 2 can be represented exactly.
    - Example
      - **1/3** $0.0101010101[01]\ldots_2$
      - **1/5** $0.001100110011[0011]\ldots_2$
      - **1/10** $0.0001100110011[0011]\ldots_2$
  - Just one possible location for the binary point.
    - This limits how many bits can be used for the fractional part and the whole number part.
    - Range of representation much too small.

IEEE Floating Point

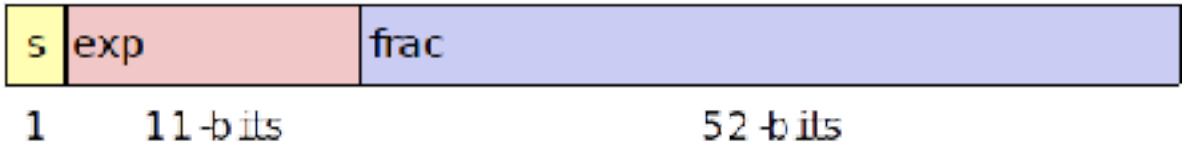
- **IEEE Standard 754**
  - Established in 1985 as uniform standard for floating point arithmetic
  - Before that, many idiosyncratic formats
  - Supported by all major CPUs
- **Driven by numerical concerns**
  - Nice standards for rounding, overflow, underflow
  - Numerical analysts and computer scientists collaborated to yield a performant and elegant solution.

IEEE precision options

Single precision: 32 bits



Double precision: 64 bits



Floating Point Representation

- **Numerical form**

$$(-1)^s * M_2 * 2^E$$

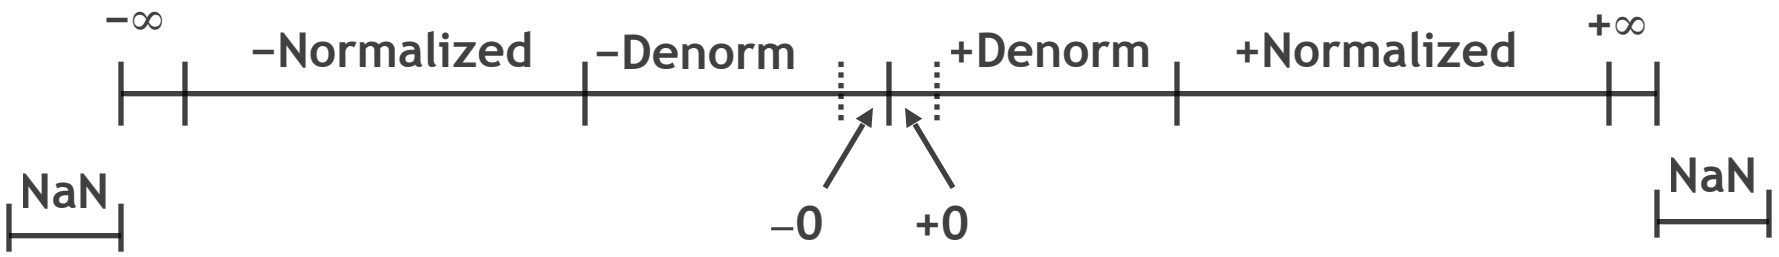
  - Sign bit ***s*** determines whether number is negative or positive
  - **Significand M** *normally* a fractional value, range [1.0, 2.0)
  - **Exponent E** weights value by (possibly negative!) power of two

- **Encoding** (3 bit vectors that encode a floating point number)
  - Most significant bit is the sign bit **s**
  - **exp** field *encodes* **E** *(but is not equal to* **E***)*
  - **frac** field *encodes* **M** *(but is not equal to* **M***)*

Interpreting IEEE Values

- Three possible methods by which we evaluate a given bit vector representing a floating point type.
  - '*Normalized*' values
  - '*Denormalized*' values *(more properly referred to as "Subnormal")*
  - '*Special*' values
- Normalized is the most common case.
- Denormalized is for representing 0 and provide a property known as "gradual underflow" where values are spaced evenly near 0.
- Special, is well, special.
- Contents of **exp** determine 'type' i.e. how to encode & interpret.

Floating point encoding number line



Normalized values

- Precondition: ***exp*** ≠ 000…0 and ***exp*** ≠ 111…1
- For some bit pattern: $\mathbf{value_{10} = (-1)^s * M_2 * 2^E}$
- **s** = sign bit ***s***
- **E** = [***exp***] - **bias**
  - **bias** = $2^{k-1} - 1$
  - **k** = number of bits in ***exp***
- **M** = 1.[***frac***]
  - By assuming the leading bit is 1, we get an extra bit for "free"
  - Smallest value when all bits are zero: 000…0, M = 1.0
  - Largest value when all bits are one: 111…1, M = 2.0- ε

Normalized encoding example

- float f = 15213.0;

$15213_{10} = 11101101101101_2$

$= 1.1101101101101_2 \times 2^{13}$

$$\mathbf{value_{10} = (-1)^s * M_2 * 2^E}$$

Normalized encoding example, *con't*

- float f = 15213.0;

  $15213_{10} = 11101101101101_2$

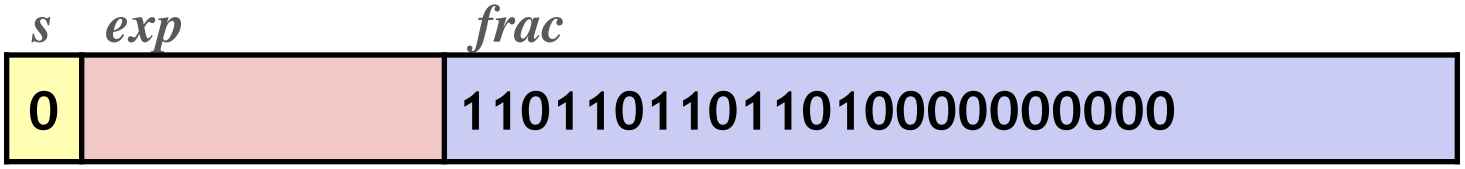
  $= 1.1101101101101_2 \times 2^{13}$

- Significand (aka Mantissa)

  M $= 1.1101101101101_2 \times 2^{13}$

  frac $= 11011011011010000000000_2$

$$\textbf{value}_{10} = (-1)^s * M_2 * 2^E$$



Normalized encoding example, *con't*

$$\mathbf{value_{10} = (-1)^s * M_2 * 2^E}$$

- float f = 15213.0;

  $15213_{10} = 11101101101101_2$

  $= 1.1101101101101_2 \times 2^{13}$

- Significand (aka Mantissa)

  M = $1.1101101101101_2 \times 2^{13}$

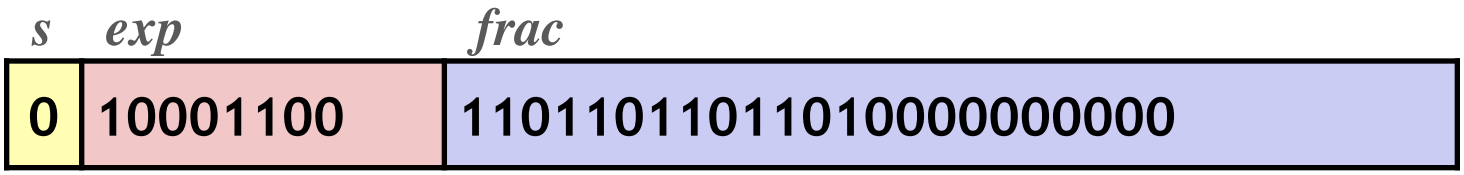
  frac = $11011011011010000000000_2$

- Exponent

  E = 13

  bias = $(2^{8-1} - 1) = 127_{10}$

  exp = E + bias = 140_{10} = $\mathbf{10001100_2}$



Range of Expression

- For normalized 32-bit single precision…
  - The value of **exp** 1…254
  - The value of **E** -126…127
  - Fairly large numbers; **<= 2^{127}**
  - Fairly small numbers; **>=2^{-126}**
- For normalized 64-bit double precision, obviously this range is greater.
- Note that there is always a leading 1 in the value of mantissa **M** for 'normalized values', so we cannot represent numbers that are *very* small.
- Next, we will observe what happens when ***exp*** is either 00…0 or 11…1

Denormalized values

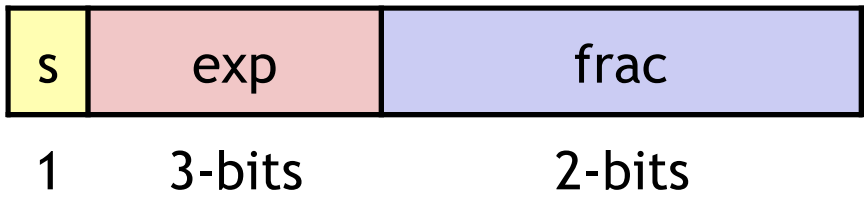
- Precondition: ***exp*** = 000…0
- For some bit pattern: $\mathbf{value_{10} = (-1)^s * M_2 * 2^E}$
- **M** = 0.[***frac***]
  - No implicit 1 prefix.
  - Allows for representation of numbers closer to 0
- **E = 1 - bias**
  - **bias** = $2^{k-1} - 1$
  - **k** = number of bits in ***exp***
  - Differs from ‘normalized’, as ***exp*** is 0, so use 1
- If ***exp*** = 000…0, ***frac*** = 000…0 represents 0.0
- If ***exp*** = 000…0, ***frac*** ≠ 000…0 represent numbers evenly spaced near 0

Special values

- Precondition: ***exp*** = 111…1
- If ***exp*** = 111…1, ***frac*** = 000…0
  - Represents positive or negative infinity, a result of overflow
  - Examples:
    - –1.0/–0.0 = +∞
    - 1.0/–0.0 = –∞
- If ***exp*** = 111…1, ***frac*** ≠ 000…0
  - Not-a-Number (NaN)
  - A case when no numeric value can be determined
  - Examples:
    - sqrt(-1)
    - ∞-∞
    - ∞*0

Tiny Floating Point

Tiny Floating Point

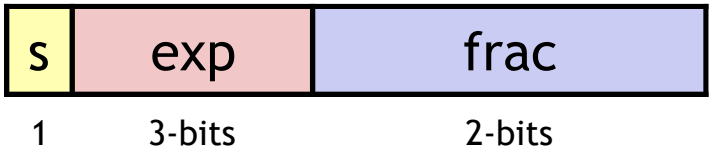


- 6-bit Floating Point Representation
  - The sign bit ***s*** is in the most significant bit
  - The next three bits are the ***exp***, with a **bias** of 3
    - Note that the **bias** is the same for all 6-bit precision numbers!
  - The last two bits are the ***frac***

- IEEE Format
  - normalized, denormalized and special values

Tiny Normalized Example 1

$$value_{10} = (-1)^s * M_2 * 2^E$$
$$E = exp - bias$$



- 000100_2 (smallest positive value)
  - $s = (-1)^0 = 1$
  - $M = 1.00_2$
  - $bias = 2^{3-1} - 1 = 3_{10}$
  - $E = 001_2 - 3_{10} = 1_{10} - 3_{10} = -2_{10}$
  - $1 * 1.00_2 * 2^{-2} = .01_2 = 0.25_{10}$
